Society of Hospital Medicine Rapid Clinical Updates HF Session 3

Heart Failure: Quality Improvement

Context: •GDMT for HFrEF reduces all-cause mortality, cardiovascular mortality, all-cause hospitalizations and/or hospitalizations for HF. Few trials have shown the additive benefits of combining these therapies.
•SGLT-2 inhibitors act on the proximal tubule of the nephron → glucoresis, natriuresis and diuresis.

•Four approved SGLT-2 inhibitors: canagliflozin, dapagliflozin, empagliflozin, and ertugliflozin.

Current State:

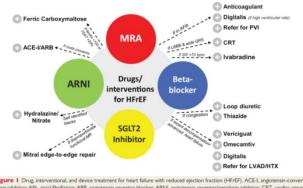

DAPA-HF Trial¹: Dapagliflozin improved composite outcome of CV death or worsening HF in patients with symptomatic HF with EF <40%. Reductions seen in patients with & without ARNI at baseline but was significant only in patients not treated with ARNI.

EMPEROR-Reduced Trial²: Empagliflozin improved t composite outcome of CV death or HF hospitalization in patients with symptomatic HF with EF <40%. HF hospitalization (but not CV death) significantly decreased.

==> When added to GDMT for HFrEF, dapagloflozin & empagliflozin reduce all-cause mortality, CV mortality, HF hospitalization, and serious adverse kidney outcomes.

==> SGLT2 inhibitors are now first-line medications for all populations in addition to GDMT³.

rigure 1 Drug, interventional, and device treatment for heart blaure with reduced ejection fraction (HrrEr). ACE-L, angotesmo-converting enyme inhibitor; ABb, atrial fibrillation; ARB, angotensin receptor blocker; ARNL, angotensin receptor/neprilysin inhibitor; CRT, cardiac resynchronition therapy; HTX, heart transplantation; LBBB, left bundle branch block; LVAD, left vertricular assist device; MR, mitral regurgitation; MRA interalocorticoid receptor antagonist; PVI, pulmonary vein isolation; SGLT2, sodium-glucose co-transporter 2; SR, sinus rhythm; TSAT, transferrin transport.

Cutting Edge: In EMPEROR-Preserved trial⁴ empagliflozin reduced the combined risk of CV or hospitalization for HF in patients with HF and preserved EF (13.8% in the empagliflozin group compared to 17.1% in the placebo group, HR 0.79, 95% CI 0.69-0.9, P<0.001).

==> SGLT2 are effective, well-tolerated and beneficial regardless of diabetic status making them **ideal** candidates for **hospitalist-led QI** initiatives.
